Fujitsu PRIMERGY BX924 S2 Dual Socket Server Blade

Server blade with virtualization fitness at all levels, be it compute power or I/O throughput

The PRIMERGY BX Blade Servers are the ideal choice for data center solutions of today and tomorrow. Our blade servers provide maximum performance and maximum redundancy, but with only minimum space requirements, low power consumption and a reduction in the time and effort required for cabling. The PRIMERGY BX system family is designed to share components between chassis in order to react quickly and easily to changing business requirements. Storage and server blades can be added without any extra effort, as would be needed when cabling or adding management software. You can use the same applications, rely on the same server and storage components and establish connections to the same networks. The PRIMERGY BX Blade Servers are flexible and have complete control via a central administration instance that is redundant in design; they minimize administrative time and effort, freeing you of time-consuming administration tasks. Our build-to-order process ensures that only completely installed and previously tested solutions are supplied, which have been precisely adapted to individual requirements and which will grow with future business requirements.

PRIMERGY BX924 S2
The PRIMERGY BX924 S2 server blade is operated by two CPUs of the Intel® Xeon® processor 5500 and 5600 series, each with up to 6 cores. Chipset and CPU provide comprehensive, hardware based virtualization support, being supplemented by additional functions of the dual port 10 Gigabit Ethernet controller Intel® 82599, integrated on motherboard. Up to 18 DIMM modules in the system allow for a scalability that was never before possible, playing into the hands of consolidation

demands in the datacenter. A large amount of applications may be controlled by Hypervisor based solutions from VMware, Microsoft, RedHat, Suse or Citrix.
Although servers are being booted more and more via network, be it with iSCSI protocols and Ethernet, or SAN topologies and Fibre Channel, this system is enabled for local boot, too. This may optionally be realized by use of solid state drives that combine outstanding performance and high reliability.
For VMware ESXi the boot procedure may also be done using a USB connected Flash Module.
The efficient administration of the entire system via ServerView is supported by the integrated Remote Management Controller (iRMC S2); the hardware monitoring and setting options can thus be optimally visualized in order to use all options at the highest energy-efficiency levels.

Features and Benefits

Main Features	Benefits
Boosting application power ■ Single-wide, half-high Server Blade, predestined for use as high performing application server. ■ The Power Blade for Virtual Machines provides 18 slots for memory and abandons the use of magnetic disk drives.	■ High performance with up to 12 processor cores for a wide variety of data center applications. ■ Requirements for remote boot and maximum available memory capacity are perfectly fulfilled hereby, thus mainly virtualized environments may be served best. ■ Easy boot of OS like a Hypervisor (e. g. VMware) via USB connected Flash Module.
Core technology for high performance ■ Next generation Intel® platform architecture realized: Intel® QuickPath for Westmere's integrated memory controllers (high-speed connections between microprocessors and external memory, and between microprocessors and the I/O hub).	■ Best-in-class performance, bandwidth, and reliability, through integrated memory controllers and a high-speed interconnect for connecting processors and other components; enables systems to fully unleash the new levels of performance that new and more powerful next generation microarchitecture-based processor cores deliver.
Power consumption under control ■ Next generation Intel® microarchitecture with Quad- and Six-Core CPUs of the Intel® Xeon® processor 5600 series (Westmere), based on the 32-nanometer silicon technology; includes different versions from LV up to high performance models; enabled to execute four instructions per clock cycle, simultaneous multi-threading (SMT) with 2 threads per core, up to 12 MB fully inclusive, fully shared L3 cache. ■ Extended Page Table (EPT) included.	■ More performance in the same power and thermal envelope. ■ Outstanding energy efficiency and performance on demand through dynamic management of cores, threads, cache, interfaces, and power at runtime. ■ Improved virtualization performance due to better collaboration between guest and host OS.
Hassle-free manageability ■ Management with integrated Remote Management Controller (iRMC S2).	■ Server access and extensive control, even at remote locations. Routine tasks and maintenance measures in the event of server problems can be conducted remotely and efficiently, thus avoiding the need for time-consuming and cost-intensive call-outs. Use of shared or dedicated Service LAN depending on customers' demands.
I/O in line with demand ■ IO components: dual-channel 10 Gb Ethernet on board, 2 slots for optional mezzanine cards (quad-channel 1 Gb Ethernet, dual-channel 10 Gb Ethernet, dual-channel 8 Gb Fibre Channel, dual-channel 10 Gb CNA (FCoE), dual-channel 40 Gb Infiniband)	■ High IO capacity of the Blade Server system itself allows for use of a large number of diverse Server Blade internal IO components in parallel
